Not illustrated. 1921 Excerpt: .the osmotic flow was from the liquid with lower to the liquid with higher surface tension (and higher intrinsic pressure). Tinker has shown that van t Hoff s theory for osmosis holds strictly only in the case of ideal solutions, i.e., when the process of solution occurs without heat of dilution and change in volume, but that in the case of non-ideal solutions Traube s ideas explain the deviations from the gas law which are bound to occur. When two different ideal solutions containing equal numbers of particles of solute in equal volume are separated by a strictly semipermeable membrane, equal numbers of molecules of water will diffuse simultaneously in opposite directions through the membrane and no change in volume will occur. When, however, the same experiment is made with two non-ideal Presidential address prepared for the Chicago meeting of the American Society of Naturalists, December 30,1920. solutions containing equal numbers of molecules in equal volume, the result is different. As Tinker has demonstrated mathematically, in this case the flow of water must be from the solution having the lower intrinsic pressure and lower surface tension to the solution with higher intrinsic pressure and higher surface tension. This is what Traube claims, and his theory explains therefore, as Tinker points out, the deviations from the gas law in the case of non-ideal solutions, but it does not prove that the gas law of osmotic flow does not hold in the case of ideal solutions and Traube s...
